

FOR IMMEDIATE RELEASE

Secura Strengthens Technology-Enabled Security Capabilities Through Upgraded Integrated Command Centre

SINGAPORE, 8 October 2026 – Secura Group Limited ("**Secura**" or the "**Group**") has completed a significant transformation of its Secura Integrated Command Centre ("**SICC**"), which is intended to strengthen the Group's ability to deliver advanced security solutions through remote monitoring, artificial intelligence ("**AI**"), digital twin technology and centralised command-and-control capabilities. Operated by the Group's wholly owned subsidiary, Soverus Private Limited ("**Soverus**"), the upgraded SICC represents a key milestone in Secura's strategy to enhance security outcomes through technology while supporting a reduction in reliance on traditional manpower-intensive operating models.

The upgraded SICC integrates remote monitoring, AI-powered video analytics and digital twin technology to enhance situational awareness and operational coordination.

The security industry is facing increasing challenges arising from labour shortages, rising manpower costs and growing demands for enhanced security coverage. Against this backdrop, Secura has been progressively investing in technology, automation and remote operations capabilities to complement conventional security services and address the evolving needs of the security industry. The SICC serves as the operational backbone of this transformation, enabling security operations across multiple sites to be monitored, managed and coordinated through a single integrated command-and-control platform.

The upgraded command centre incorporates advanced surveillance technologies, including next-generation 360-degree cameras, AI-powered video analytics and digital twin capabilities, providing operators with enhanced situational awareness and operational visibility across monitored sites. These capabilities are designed to enable incidents to be detected, assessed and responded to more efficiently, which supports improved service delivery and operational effectiveness for clients.

A key feature of the enhanced SICC is the deployment of a live digital twin environment integrated with real-time surveillance and operational data. By providing operators with an interactive three-dimensional representation of monitored environments, security incidents can be visualised, assessed and responded more effectively than through conventional monitoring methods. Beyond security operations, the platform provides a foundation for future applications in facility management, operational planning, emergency preparedness and training.

The transformation of the SICC supports Secura's broader vision of building an integrated security platform capable of delivering more scalable and sustainable security solutions. By integrating technology with operational expertise, the Group aims to improve productivity, optimise resource deployment and enhance service quality while responding to the evolving needs of customers.

The enhanced command centre also strengthens the Group's capability to deliver a wider range of advanced security services across multiple sectors, including commercial buildings, industrial facilities, educational institutions, healthcare facilities, government agencies and critical infrastructure. Potential service offerings supported by the platform include remote monitoring services, AI-enabled surveillance solutions, virtual security patrols and digital twin-based operational monitoring.

The development of the enhanced SICC was undertaken in collaboration with Vizzio Technologies Pte. Ltd., whose digital twin and advanced surveillance technologies have been integrated into the platform to support the Group's remote operations and monitoring capabilities.

Commenting on the transformation, Mr Kelvin Goh, Managing Director of Soverus, said:

"The completion of our enhanced SICC marks an important milestone in Secura's ongoing transformation. As manpower constraints continue to challenge the security industry, remote operations, AI and automation will play an increasingly important role in enhancing service delivery. Through SICC, we have consolidated these capabilities into a single platform that strengthens operational oversight, improves responsiveness and supports future growth opportunities."

The transformed SICC underscores Secura's commitment to innovation and its long-term vision of combining manpower, technology and remote operations to deliver integrated security solutions. The Group will continue to invest in capabilities that enhance operational efficiency, improve service delivery and support the evolving security requirements of its customers.

ABOUT SECURA GROUP LIMITED

Secura Group Limited (“**Secura**”) is one of Singapore’s leading providers of an integrated suite of security products, services and solutions. Its security guarding business, **Soverus Pte Ltd**, provides unarmed manned security guarding services and operates the Secura Integrated Command Centre, a 24-hour command centre that supports remote monitoring, AI-powered video analytics and surveillance operations across multiple sites. Alongside this, **Soverus Kingdom Systems Pte Ltd**, specialises in the delivery and integration of digital security and access control solutions. With more than a decade of industry experience, Soverus Kingdom supports clients with technology enabled systems that enhance security, operational efficiency and compliance requirements.

The Group also operates one of Singapore’s most established security printing businesses, **Secura Singapore Pte Ltd** founded in 1976 and commemorating its 50th anniversary this year. Leveraging decades of specialised expertise, the business produces a wide range of secure, high-quality documents incorporating anti-counterfeit features, including bank cheques, passbooks, educational certificates and other value documents, serving institutions that require trusted and reliable document security.

Complementing its physical and document security capabilities, Secura provides a comprehensive suite of cybersecurity services through **OneSecure Asia Pte. Ltd**. These services include 24/7 security operations centre (SOC) monitoring, detection of web spoofing and site defacement, and mitigation of Distributed Denial-of-Service (DDoS) attacks, enabling organisations to strengthen their digital defences with continuous threat detection and expert technical support.
